

ACREAGE: 80.0 | YEAR ACQUIRED: 1973, 1974, 1975, 2001

Here are a ridge moraine, a kettle-hole lake and boulders from rocky outcrops farther north, all visible evidence of the passing of the great glaciers. The low wetland was once an acidic bog with sphagnum moss and cranberries. Now tamarack, yellow birch and red maple grow there along with tussocks of cinnamon fern, mountain holly and winterberry. On the drier land is an oak/hickory forest with red, white and black oak, as well as shagbark hickory, and in the understory are sassafras, dogwood and hazelnut. The varied habitat means a variety of birds and wildflowers are present.

Immature White Oak Leaf

DIRECTIONS:

From Orland take SR 120 east 2.1 miles to 750 W and turn left (north). Travel 0.1 miles to the preserve on the right.
